

# Safety Stock Optimising:

Understand all the elements at work in your inventory

## Safety stock management reviews

Modern commerce is based on one very simple premise: **supply and demand**. Unfortunately, while it may be simple to understand, it's anything but simple to manage. Over time, demand for your stock and your **ability to service that demand** both vary, making **forecasting uncertain** and leading to poor customer service, high distribution costs, slow deliveries, high stock levels, high inventory carrying costs and high back orders, often all at the same time.

In order to resolve these costly issues, you need some stock on hand – safety stock – to reduce inventory shortages (stock-outs). The trick is to figure out exactly what stock to store and how much of it.

At STL Warehousing, we have the hands-on experience with safety stock management to do exactly that. We understand all the elements at work in your inventory, and we see the complete process, not just the individual activities. We can **optimise your safety stock levels** to give you **improved customer service**, reduced **inventory**, raised **productivity**, reduced **cost** and reduced **response time** to market changes.

## Safety stock management reviews

Our safety stock management reviews include:

- Operational review of your current safety stock
- Service level review
- Cost review
- Modelling of your safety stock
- Statistical service level safety stock recommendation
- Inventory projection
